FOREWORD: This publication is intended for mining geologists, stratigraphers, petrographers, and mineralogists.

CONTENTS: This collection of articles is devoted to a description of several minerals found in Eastern Siberia, and a discussion of the conditions of their deposition by regions. Individual articles report on the Berezovskoye iron ore deposits, the titaniferous minerals of the Sakal'skoye deposit, the iron ore deposits of the Angara-Pitkiy basin and the Kropotkiy region. The articles are accompanied by diagrams, tables, and bibliographic references.

TITLE:

Kinetics and Mechanism of the Decomposition of Hydrocarbons (Kinetika i mekhanizm raspada ulevodorodov) XIII. Kinetics of the Butane Cracking Inhibited by Propylene Additions (XIII. Kinetika krekinga butana, zatormozhennogo dobavkami propilena)

PERIODICAL:

Zhurnal fizicheskoy khimii, 1959, Vol 33, Nr 1, pp 8-14 (USSR)

ABSTRACT:

The theory of the chain cracking of hydrocarbons inhibited by additions of various inhibiting agents was developed already some years ago (Refs 1-4). According to Hinshelwood (Ginshel'vud) (Ref 6) and the results of some investigations (Ref 5), the butane cracking is carried out in a complicated kinetic process. This assumption is, however, unfounded considering the decomposition of the radical chains of the alkanes and the structure of butane. The present tests were carried out to clarify this question, to determine the activation energies of the inhibiting reaction, and to establish the working mechanism of propylene. The cracking of butane with propylene additions was carried out in a vacuum unit the description of which has

Card 1/3

SOV/76-33-1-2/45

Kinetics and Mechanism of the Decomposition of Hydrocarbons. XIII. Kinetics of the Butane Cracking Inhibited by Propylene Additions

already been given together with the working method (Ref 7). The pressure was measured by means of a diaphragm pressure gage, the temperature by means of a potentiometer PP. Two series of investigations were made at 540° and 580°C respectively (Table 1). The results of the investigations showed, after a treatment of the reaction walls (quartz glass) with HF, that an enlargement of the specific surface intensifies the inhibiting reaction which points to a heterogeneous origin of the chain formation and, on the other hand, to a homogeneous fission of the chains in the cracking reaction (Refs 1,8). According to the calculations by A. D. Stepukhovich, the value 13.4 kcal is given for the activation energy of the admission of  $\text{CH}_3$  radicals at the walls of the quartz vessel. The determinations made according to the method of inhibiting additions showed a value of 2.7 kcal for the activation energy of the reaction of propylene with H radicals, and a value of 11 kcal for the reaction with  $\text{CH}_3$  radicals. The decomposition of butane does not constitute an exception from the general laws of reaction kinetics of the inhibited radical chain

TITLE: Determination of Boundaries of Pressure Shrinkage Holes in Brass and Bronze Rods by the Method of Ultrasonic Flaw Detection 14

PERIODICAL: Sb. materialov po avtomatiz. proizvod. protsessov i dispatcherizatsii, Nr 3, Moscow, 1958, pp 68 - 83

ABSTRACT: Information is given on results of studies carried out to determine the boundaries of pressure shrinkage-holes with the use of ultrasonic waves. The possibility was established of using for this purpose (for rods of  $\leq 70$  mm in diameter) the "UZD-37"-device. The ultrasonic control diminishes the number of breaks in testing the rods and reduces metal loss. For a number of alloys ultrasonic control is the only method to determine precisely the boundaries of a deficient area in the rod. The author analyzes in detail characteristics and variety of defects in pressed rods.

A Universal Ultrasonic -38 (UZD-38 Type) Flaw-Detector for Detection of Defects in Titanium, Non-Ferrous and Ferrous Metals

the piezoplates under operational conditions. The design of the equipment was devised for the operation in shops. The dimensions are 505 x 315 x 235 mm, the weight is 20 kg. The flaw detector may be used in enterprises of the non-ferrous metallurgy for 1) detection of defects in ingots of Ti and its alloys; 2) detection of defects in work-pieces of non-ferrous metals and their alloys; (Al, brass, bronze and others); 3) for the checking of technological equipment as to the absence of internal defects; 4) for measuring the wall thickness of work pieces made of ferrous and non-ferrous metals with one-way access (boilers, pipes, reservoirs, etc). The main electrical circuit diagrams of the device are given and special features in its design are described.

New Means for Automatic Testing and Control in Non-ferrous Metallurgy

(Figure 3). For the continuous analysis of hydro-metallurgical solutions, the KB TsMA in 1957 developed (Figure 4) an automatic polarographic concentration-meter, type KAP-225, with a transducer type DAPK-226: this device has been successfully used at the "Elektrotsink" Works for analysing for cadmium in zinc electrolyte and is based on alternating-current polarography. The KB TsMA have developed a series of radioactive methods, particularly for level indication over a wide (type URP) (Figure 5) and a relatively narrow (type URPR) (Figure 6) range. A radioactive density-meter, type PR-150, independent of the mineralogical and size composition of pulp over a wide range has been successfully tested at the Zolotushinskaya obogatitel'naya fabrika (Zolotushinskaya Beneficiation Works) (ranges 1.5-2.5 and 1-2 kg/litre). Work is proceeding on other radioactive meters including a moisture meter, for concentrates and similar materials. Based on corrosion-resistant, differential, thermo-electric anemometer (electrical circuit proposed by engineers V.A. Drozdov and A.M. Listov), a flowmeter for pure or air-diluted chlorine has been developed by the

Card2/4

SOV/136-58-6-3/21

## New Means for Automatic Testing and Control in non-ferrous Metallurgy

KB TsMA; they have also developed an analyser (type GAKh-239) for chlorine which is accurate to  $\pm 3\%$  and these two instruments are to be used in an integrated automation system being devised for the magnesium industry. The KB TsMA have developed an automatic installation for (Figures 7 and 8) controlling a single pump in relation to the liquid level. Another recent activity of this organisation has been the development of the type ATV-229 overheating protective device (Figure 9) and a twelve-point temperature signalling device (Figure 10). The ATV-229 device is to be produced by the Tsvetmetpribor Works. In collaboration with the Institut gigiyeny truda i profzabolevaniy AMN SSSR (Institute of Work Hygiene and Occupational Diseases of the AMS USSR), the KB TsMA have developed a device (Figure 11) for continuous measurement and recording of mercury-vapour concentration in air in the range  $0.1 - 0.6 \text{ mg/m}^3$ . This instrument (IKRP-445) (Figure 11) also gives an alarm signal if the concentration becomes excessive and its range is being extended in both directions.

AUTHOR: Birger, G.I.

TITLE: Some problems of calibrating ultrasonic flowmeters

PERIODICAL: Izmeritel'naya tekhnika, no.10, 1962, 53-55

TEXT: Ultrasonic flowmeters indicate the average speed of flow along the ultrasonic beam and not the average across the section. For circular pipes an ultrasonic flowmeter will give a higher reading of about one-third if the flow is laminar. Under industrial conditions the flow is usually turbulent and the velocity across the section varies with the Re number. In this case the velocity along the ultrasonic beam is also a function of Re. The ratio between the ultrasonically measured velocity and the average velocity will also not remain constant and will be a function of Re. In contrast to the formula published by J. Kritz

$$v = \bar{v}(1 + 0.19 Re^{-0.1}), \quad (2)$$

where  $v$  - ultrasonically measured velocity and  $\bar{v}$  - average

B/046/63/009/001/001/026  
B104/B186AUTHORS: Birger, G. I., Brashnikov, N. I.TITLE: Temperature errors and the calculation of some parameters  
of ultrasonic flowmeters

PERIODICAL: Akusticheskiy zhurnal, v. 9, no. 1, 1963, 5-9

TEXT: In two-channel ultrasonic flowmeters the main temperature error is caused by simultaneous temperature variations both of the controlled medium and of the acoustic line material; in single-channel flowmeters the main error is caused by a similar effect. Another temperature error arises in the asymmetric electronic systems. In flowmeters of the two-channel phase circuit type with refraction the main temperature error is determined by

$$|\delta\varphi_s| = \frac{b_1 + b_2(1 - 2n_0^2 \sin^2 \alpha)}{1 - n_0^2 \sin^2 \alpha} \Delta\varphi \delta t, \quad (1),$$

where  $b_1$  and  $b_2$  are the relative temperature coefficients of the ultrasonic

Card 1/2

Temperature errors and the ...

S/046/63/009/001/001/026  
B104/B186

velocities in the acoustic line material and in the controlled medium;  $n_0 = c_{20}/c_{10}$  is the index of refraction of the ultrasonic waves on the boundary material - controlled medium;  $\alpha$  is the angle between the acoustic line axis and the normal to the tube axis;  $\Delta\varphi$  is the phase shift of the ultrasonic vibrations;  $\delta t$  is the temperature variation of the controlled liquid. By selecting a material for the acoustic line with proper  $c_{10}$  and  $b_1$  the main temperature error could be kept small. An automatic compensation of the main temperature error is achieved by the condition

$$\sin \alpha = \frac{1}{n_0} \sqrt{\frac{b_1 + b_2}{2b_1}} \quad (3).$$

Therefore, if  $b_1 < 0$  an automatic compensation of the main temperature error may be obtained for most of the liquids with  $b_2 < 0$ . Finally the design of pickups with temperature compensation at  $b_1 > 0$  is discussed. There are 3 figures and 1 table.

AUTHORS: Konkin, A. A., Rogovina, A. A., Birger, G. Ye.  
TITLE: Present stage and prospects of tire cord production  
PERIODICAL: Khimicheskiye volokna, no. 1, 1961, 3-14

TEXT: This is a review of publications on the production of tire cord, which bases primarily on Western literature. In the Soviet Union, tire cord is produced from cotton, viscose and caprone fibers. As the Seven-year Plan (1959-1965) provides for a substantial increase of the production of viscose cord (2.8 times) and caprone cord (22 times), 91% of all tire cord will be made from synthetic fibers in 1965. The review is divided into five sections: 1) Achievements in the field of viscose and polyamide cord production. This section bases chiefly on Western literature. 2) Physicomechanical properties of viscose, caprone, and nylon cord. Besides several Western publications, mention is made of a paper by V. A. Kargin and a paper by M. B. Lytkina, Ye. Ya. Yaminskaya, V. F. Yevstratov, and Ye. V. Troshkina on impact tests: BX (VKh) cord withstood 50 impacts, cord "Super-super", 129, and caprone cord, 850. The optimum modulus and elongation have not yet

Card 1/4

S/183/61/000/001/002/006  
B101/B205

Present stage and ...

been determined. Tests made by A. V. Motorina, A. A. Konkin, N. V. Mikhaylov, and others confirmed that the behavior of polyamide heated in an inert atmosphere differs from that heated in air. 3) Brief analysis of data on the testing and practical use of tires made from different types of cord. It is noted that the NIIShP (Scientific Research Institute of the Tire Industry) has made several tests of tires which showed that caprone cord is best suited for the purpose. This is ascribed to the poor quality of viscose cord. 4) Technical and economic data on the use of viscose and polyamide cord. This section deals with an investigation carried out by VNIIV (All-Union Scientific Research Institute of Synthetic Fibers) in cooperation with the Scientific Research Institute of the Tire Industry, in the course of which the highly stable cord no. 5.45/2/1 was compared with caprone cord no. 10.7/2/1. Both types were assumed to have a lifetime of 63,000 km. When putting the cost of viscose cord as 100%, the following figures are obtained for caprone cord:

Capital cost	
Creation of the raw-material basis .....	138
Production of raw material and fiber .....	142

Cord and rubber (per 1000 km) .....	101.8

The costs for sulfate cellulose and caprolactam were taken from planning figures. According to estimates of GIAP (State Design and Scientific Research Institute of the Nitrogen Industry) and of the All-Union Scientific Research Institute of Synthetic Fibers, the corresponding figures for anide fiber are 107% and 120%, respectively, when putting capital cost and prime cost of caprone cord fiber as 100%. The high price is due to the costs of AP("AG") salt. According to I. Ye. Krichevskiy and N. P. Fedorenko, a price cut is possible by using non-aromatic starting materials, such as furfurool and butadiene. 5) Prospects of the use of other fibers in the production of tire cord. Reference is made to Western data on polyester, polyvinyl

Present stage and ...

alcohol, polypropylene, and polyurethane fibers. The authors state that further research work would be necessary. They recommend caprone cord for the production of truck tires, and viscose cord for automobile tires. The development of caprone cord production intended in the Soviet Union does not exclude the production of nylon cord. V. L. Biderman and P. Kh. Drozhzhin are mentioned. There are 5 figures, 10 tables, and 53 references: 17 Soviet-bloc and 34 non-Soviet-bloc. ✓

Title : Comparison of failure theories for fatigue strength criteria

Periodical : Vest. mash. 9, 14-20, Sep 1954

Abstract : The fatigue strength under combined stresses, especially normal and shear stresses which vary asymmetrically, were considered. Various theories of failure were applied to the cases of pure tension, pure torsion, alternating flexure and constant torsion, alternating torsion and constant flexure, alternating torsion and bi-axial constant tension and compression. The advantages and drawbacks of each of the five theories discussed are pointed out. Seven USSR references (1933-1954). Graphs.

AUTHOR: Shneyderovich, R. M. (Moscow)

TITLE: Elasto-Plastic Bending of Bars and Systems of Bars  
(Uprugo-plasticheskiy izgib sterzhney i sterzhnevnykh sistem)

PERIODICAL: Izvestiya Akademii Nauk SSSR, Otdeleniye Tekhnicheskikh Nauk, 1958, Nr 3, pp 130-134 (USSR)

ABSTRACT: The relations between the stress and deformation components can be stated in relative co-ordinates referred to the yield point values. With this notation, the relations of the elastic region can be used in the plastic region, accepting variable elastic properties. This method, introduced by Birger, I.A. ("Certain General Methods for the Solution of Problems in the Theory of Plasticity", Prikl.Mat. i Mekh., 1951, Issue 6), reduces elasto-plastic problems to those of pure elasticity if the variable factors are known. These factors can be presented in families of curves, such as Fig.1 for the bending of round bars. The stress distribution over the cross-section is considered and formulae are given replacing the Mohr-Maxwell displacement formulae in energy theorems for the case of elasto-plastic deformation. These formulae are used for statically indeterminate systems of which an example is treated, namely a chain link with a central bridge. There are 6 figures, including 5 graphs, and 6 Soviet refer-

BIRGER L.A.

AUTHOR: Ivlev, D.D. 80V/24-58-4-33/39

TITLE: Conference on Sustained Static Strength of Turbine Components Working at High Temperatures (Soyezbchaniye po dilitel'noy staticheskoj prochnosti detalj turbomashin, rabotayushchikh pri vysokoy temperature)

PERIODICAL: Izvestiya Akademii Nauk SSSR, Otdel'noye izdaniye Sibirskoye Nauch. 1959, Nr. 4, pp. 149 - 150 (USSR)

ABSTRACT: The Commission on the Strength of Gas Turbines from the Institute of Mechanics of the USSR (Academy of Sciences) Chairman - Yu.N. Rabotnov) and the Strength Section of the Leningrad Technical Committee on Turbine Construction (Chairman - L.A. Kantor) held a conference during November 20-22, 1957 on the static strength of turbine components working at high temperature. The conference was opened by an introductory speech by the chairman of the Leningrad Technical Committee on Turbine Construction, S.A. Kantor.

The paper by L.A. Odling (Institute of Metallurgy, Ac.Sc. USSR) "Structural Theory of Creep" contained an account of the author's theory.

Card 1/7

L.S. Izrael and L.K. Korovin (Institute Metallurgy, Ac.Sc. USSR - Institute of Metallurgy of the Ac.Sc. USSR) in the paper "Experimental Investigation of Some Aspects of the Problem of Structural Creep" described results concerning the theory of creep.

L.A. Kantor (Vestnik Otdela) in his theory saved in Leningrad Metal Factory in Leningrad, in his paper "The Field of Static Strength of Turbine Components Working at High Temperature" dealt on data obtained in Leningrad industrial undertakings indicating the need for further improvement in design and constructional procedure.

The basic problem in the author's opinion is not so much the investigation of the stresses in individual components as the investigation of the limiting states of actual constructions. The author also noted the need for experimental investigation of model rotors, disks and turbine casings and suggested setting before the Government the problem of organizing such an assembly in one of the factories with the central material and co-ordination of work in this direction.

The author criticized the inadvisable unplanned work taking place at the present time in the USSR in the field of testing, which must itself solve problems relating to basic, scientific, methods of testing, and appropriate apparatus, criteria for the strength of components at high temperatures.

L.A. Birger (TsIAM) presented a paper on "Standards of Strength of Components at High Temperatures". A.P. Dvorkin (TsIAM) gave a paper on "Investigation of the Bearing Capacity of Disks".

R.A. Koron' (Leningradskiy metallicheskii zavod im. Starina - Leningradskiy metallicheskii zavod im. Starina) gave a paper on "Investigation of the Bearing Capacity of Turbine Components".

Apparatus for testing sustained strength of some turbine components dealt with tests of equipment constructed at the Leningrad Metal Factory. The stress state in a number of components investigated is described. V.S. Krasovskiy (Moskovskiy gos. inzh. in-st. im. Stroy. i Mashinostroyeniya) gave a paper on "Creep of Heat-Resistant Alloys at High Temperature". The author described experimental investigations on the behavior of the steel EI-257 and EI-405 under conditions of complex stress and high steady temperature.

Variatsionnyye metody v stroitel'noy mekhanike turbomashin  
(Variational Methods in Structural Mechanics of Turbomachinery)  
[n.p.] Oborongiz, 1959. 27 p. 2,850 copies printed.

Ed.: Yu. I. Korostelev, Engineer; Ed. of Publishing House:  
S.I. Vinogradskaya; Tech. Ed.: L.A. Garnukhina.

PURPOSE: This booklet is intended for engineers dealing with problems of strength and dynamics of gas and steam turbines, axial compressors, and other turbomachinery.

COVERAGE: The author presents general principles of variational methods and describes their application to the problems of strength and dynamics of turbomachinery. Use of variational methods in the analysis of bending, vibration, and torsion of blades and disks is discussed. No personalities are mentioned. There are 13 references, all Soviet.

Kruglyye plastinki i obolochki vrashcheniya (Circular Plates and Shells of Revolution) Moscow, Oborongiz, 1961. 367 p. Errata slip inserted. 3275 copies printed.

Ed.: Yu.G. Zakharov, Candidate of Technical Sciences; Ed. of Publishing House: N. A. Ageycheva; Tech. Ed.: A. Ya. Novik; Managing Ed.: A. S. Zaymovskaya.

PURPOSE: This book is intended for structural engineers and scientific research workers concerned with problems of the strength of plates and shells.

COVERAGE: The book is concerned primarily with the analysis of general problems of symmetrical, structurally orthotropic circular plates and shells of revolution with closely spaced stiffeners. Particular attention is given to the design of plates and shells for strength under conditions

Card 1/1

TEXT: The author considers the approximate theory of variable section beams which have changing strength parameters and are subject to external forces and uneven heating. On the basis of the hypothesis of plane sections, the displacement of an arbitrary point along the axis is analysed. It is assumed that no transversal normal stresses are present. After some mathematical elaboration

$$\sigma = E \left( \frac{N}{\int_F E dF} + y \frac{M_x}{\int_F E y^2 dF} - x \frac{M_y}{\int_F E x^2 dF} \right) +$$

$$+ E \left( \frac{\int E \alpha t dF}{\int E dF} + y \frac{\int E \alpha t y dF}{\int E y^2 dF} + x \frac{\int E \alpha t x dF}{\int E x^2 dF} - \alpha t \right) \quad (15)$$

for the stress is deduced, in which the first part expresses stresses due to external load, and the second - the temperature stresses. In the next item, axes, x and y are determined in the usual manner, and an arbitrary system,  $x_2y_2$ , is chosen. This determines the reduced center of gravity of the section in the system. The extreme conditions at the end of beam are defined by Saint-Venant, i.e. the stresses have the same vector and main torque as the system of external forces. The use of Eq. (15) is illustrated by a numerical example. In the calculation of variable section beams it is assumed that the normal stresses are determined by Eq. (15) if all parameters are referred to the given section. This provides sufficient accuracy. The tangent stresses in the beam are assessed by the condition of equilibrium of its element. An equation is deduced which is compared

to the expression of stress in a beam with constant modulus of elasticity, and the latter is acceptable for practical purposes. When the normal force is zero, then a simplified form is obtained, whose first member represents the tangent stress in the section of a prismatic beam, whereas the second member takes into account the effect of variable section. This is followed by an analysis of distributed forces, including those that are parallel to the axis, and also cases of tangent stresses due to bending of thin-walled beams. The evaluation of errors in the case of an approximate solution is given in the example of bending and tension of a wedge. In the approximate theory of beams, the stress  $\sigma_y$  is disregarded. The author quotes equations for bending due to torque<sup>y</sup>, and also bending of a wedge by a concentrated force, followed by the instance of distributed load. The comparative tabulated results indicate that the error of the approximate solution increases with greater angles  $\alpha$ , although it is acceptable in the majority of cases. The method of Saint-Venant is also applied in the problem of beam torsion, where the mathematical analysis provides

$$M_k = \int_F (\tau_{zy} x - \tau_{zx} y) dF = \lambda c \quad (25)$$

for the torque ( $C$  is the rigidity of the beam). The solution can be obtained with the function of stress  $\Phi(x,y)$ . The simple problem of torsion of a round shaft with axial symmetry distribution of the modulus of elasticity is then discussed. It is followed by an example of an elongated rectangular section beam. The analysis provides the expressions for the normal stresses which comprise the stresses due to tension and bending as well as the normal stress of strained torsion. Tangent stresses distributed linearly along the wall are produced in the section of the beam. In this case the center of torsion coincides with that of stiffness. Curved beams are then considered. When their curvature is small then the relationship that were established for straight axis beams may be used. The author analyzes beams with larger curvature and symmetrical cross section. To determine the tangent stresses, consideration is given to the condition of equilibrium of a separated part of beam element. When the radius of curvature tends to infinity, then the equation of stress for this case coincides with that for a beam without distributed forces. The axial symmetry deformation of rings, subject to distributed loads and torques and with symmetrical distribution of temperature and strength parameters is analyzed. This assu-

med that the cross section of the ring is not distorted. An instance when the cross section of the ring is small in relation to the radius is considered. Finally, to calculate the work of beams in the elastic and plastic stage, use is made of the method of variable parameters of strength. The assumption of incompressibility of material simplifies the computation. Another method quoted is based on successive approximations which is in good agreement with the practice concerning beams, discs and cylindrical shells. There are 31 figures, 2 tables and 4 Soviet-bloc references.

TITLE: Calculating flexural ring springs

SOURCE: Raschety na prochnost'; teoreticheskiye i eksperimental'nyye  
issledovaniya prochnosti mashinostroitel'nykh konstruktsiy.  
Sbornik statey. no. 7, 1961, 110 - 121

TEXT: It is assumed that the spring has  $n$  slots in each section, and therefore, an angle of  $\alpha = 2\pi/n$  corresponds to each slot. (Fig. 3) The cross section of the ring is considered as small in relation to its radius, and thus usual methods of calculation are applied. Due to symmetry, the section of ring containing angle  $\alpha$  is analyzed, and is separated by planes passing through A and C. The arbitrary section being discussed is determined by angle  $\varphi$  counted from the base radius OA. X

$$M_{Kp}(\varphi) = -M_{u3}(0) \sin \varphi + \frac{PR}{2n} (1 - \cos \varphi). \quad (3)$$

defines the bending moment. The ratio of maxima of the torsion and bending moments is  $\frac{M_t \max}{M_b \max} = \text{tg } \frac{\alpha}{8} = \text{tg } \frac{\pi}{4n}$ . This ratio decreases when n

goes up. The most critical section of the ring must be calculated. The above is indicated for various cases. The contraction of the ring is determined by the theorem of Castiglione. The contraction is equal to the displacement of point B in relation to the straight line that connects A and C. When the section of spring contains i rings, then the contraction is  $\delta$ , but the effort taken up by the former is iP. If the spring has several sections, then the total contraction is equal to the sum of contractions of the individual sections. In the case of a spring with connected rings the bridge pieces are considered as being rigid. At the supporting points, concentrated loads P/n and torques,  $M_c$  (Fig. 8) are applied. A section inclined by angle  $\alpha$  is separated. Both bending and torsion moments may act in the end sections. The analysis brings out the coefficients  $\gamma$ ,  $\chi$  and  $\lambda$ . The value of the coefficient for a ring with rectangular section and two slots in each section ( $\alpha = \pi$ ) is  $0.22 \leq \chi \leq 0.42$ . When the latter magni-

tude is found, then the bending and torsion moments can be computed. The comparison of curves of these moments reveals that the critical section in a connected ring rises sharply when compared to free rings. In the case of a ring section with large stiffness on bending, the contraction of spring is determined by its torsional rigidity. Finally, a comparison is made between the ring springs and the usual coiled helical units, and a numerical example is quoted. This demonstrates that the cylindrical slotted spring possesses a markedly larger carrying capacity than the helical spring of the same overall dimensions, but its deflexion is considerably lower. The compliance of free-ring spring can be increased by the choice of the latter's section. There are 11 figures, 1 table and 2 references. 1 Soviet-bloc and 1 non-Soviet-bloc.
